

SAFETY PROBLEM

Cleaning products used primarily in the kitchen and bathroom by persons are as bad for lungs as smoking 20 cigarettes a day, scientists warn. The research was published in the *American Thoracic Society's American Journal of Respiratory and Critical Care Medicine*.

A long-term study has revealed that regular use of cleaning sprays has an impact on health comparable with smoking regular use of cleaning sprays has an impact on lung health comparable with smoking a pack of cigarettes every day, according to a new study.

SOLUTION

The use of the Pure-Light Super-Oxygen Bulbs and Super-Oxygen Kitchen coating formulations eliminate the need of caustic and dangerous chemicals often used in cleaning to prevent/clean mold and fungus and harsh chemicals for general cleaning. With the Pure-Light Kitchen coatings, treated surfaces are much easier to clean and can be cleaned easily with plain water. Additionally, the Super-Oxygen action from the coatings and Pure-Light bulbs strongly discourage microbial and fungal growth, providing a cleaner, fresher, and safer environment while also helping eliminate the need for chemical deodorizers and air fresheners.

ANOTHER EXAMPLE OF PURE-LIGHT CAN FIX THAT

PROBLEM

Anti-Bacterial wipes pointless as bugs grow back in 20 minutes on kitchen surfaces, scientist says. Anti-bacterial wipes only eradicate bacteria from kitchen surfaces for 20 minutes and using them to keep germs at bay is “*an absolute redundant*” exercise, a scientist has said. Dr Clare Lanyon, a biomedical scientist from Northumbria University in Newcastle said consumers may be wasting money on antibacterial wipes and sprays because common germs, which can replicate themselves in just 20 minutes, quickly recolonize back to original mass even if just one single cell is left over.

Dr Lanyon was speaking to *The Telegraph* after conducting an experiment for the BBC programme, *Trust Me I'm A Doctor*, which found “dramatic growth” of microbes within 12 hours of cleaning of regular kitchen surface with wipes. But keeping Kitchen work surfaces germ-free was impossible because they are found throughout the home and therefore rapidly repopulate, she said. “*Some bacteria can divide every 20 minutes, so it doesn't take long for one cell to become one million cells – in fact it would only take around 6.6 hours,*” Dr Lanyon told *The Telegraph*.

SOLUTION

Recent PURE-LIGHT tests demonstrate that Pure-Light has a continuous “breakdown and dissolve” action against harmful bacteria and viruses, even against the extremely hard to kill E-Coli, Salmonella, and the almost impossible to kill MRSA. With Pure-Light, if the light is on, the photocatalytic action produces super oxygen molecules, which breakdown and dissolve the cell walls of bacteria, viruses, and mold. This continuous action is much more effective than many other typically used methods.
